Ideal Cat Weight: Tips for Obese & Skinny Cat

Ideal Cat Weight: Tips for Obese & Skinny Cat

To care for a furry little feline munchkin like an expert, you need to be particularly attentive to their emotional and physical well-being and treat them with empathy and care, and voila, you'll be able to understand your furball better than anyone else, predict their behaviour, and even meaningfully train them to be your purr-fect furry friend!

Understanding Your Cat

To care for a furry little feline munchkin like an expert, you need to be particularly attentive to their emotional and physical well-being and treat them with empathy and care, and voila, you'll be able to understand your furball better than anyone else, predict their behaviour, and even meaningfully train them to be your purr-fect furry friend!

One thing to know about cats is that they are generally resilient. The average healthy cat can enjoy a lifespan ranging between 15 to 18 years. However, cats are also known to have little to no resistance to certain health conditions. The most common and threatening ones are malnutrition and obesity. Therefore, as a cat parent, it is crucial to be aware of the ideal cat weight to make sure your kitty is able to enjoy a healthy lifestyle without the health concerns that arise from malnutrition and obesity.

Cat Weight Chart

	Too Thin	Underweight	Ideal	Overweight	Obese
Cat Weight Chart	Weighs under 2.5 to 3 kg	Weighs under 4 kg	Weighs between 4 to 4.5 kgs	Weighs over 5kgs	Weighs over 6 to 6.5 kgs
	Ribs and backbone can be prominently felt and is distinctly visible	Ribs and backbone can be easily felt and is somewhat visible too	Ribs and backbone can be felt under the skin but is not visible	Ribs and backbone can be felt with difficulty under a layer of fat	Ribs and backbone cannot be felt at all

Ideal Cat Weight

Although the normal cat weight can change depending on the age and breed of the cat, most cats are preferred to have a weight ranging up to 10 lbs (4-4.5kgs), while larger cat breeds, such as Maine Coons and Persian cats can have an ideal weight of 25 lbs (11kgs).

Being underweight or overweight can have a significant impact on a cat’s lifestyle, as well as its longevity. Not having the ideal weight of a cat for its age and breed can harm your feline munchkin’s well-being by detrimentally impacting its immune system, making it more prone to diseases it wouldn’t otherwise be affected by.

Average Cat Weight

When it comes to furry felines, their normal weight is possibly one of the biggest factors to consider when it comes to their general health and well-being. The average cat weight keeps changing depending on their age and breed and it is important that you make sure your kitty has an ideal cat weight for its age and breed. You can easily find out if your fur kiddo is overweight or underweight by feeling its ribs under the skin. Ideally, the rib cage of cats can be felt under their fur and thin layer of skin and fat. Being able to feel the rib cage can prove to be difficult in obese cats, whereas they will be distinctly felt and prominently visible in a cat skinny.

Fat Cat Weight

Unrestrained food consumption is undoubtedly the leading reason behind feline obesity, however, there are several other causal factors that might result in your feline buddy getting overweight or obese. Their immediate environment and the type of food cats consume play an active role in determining their weight. Cats are one of the most efficient predators, and in the wild, they often rely on their hunting skills to survive. This allows cats to stay in shape by burning excessive calories. Domestic cats, on the other hand, do not need to hunt their food, exposing them to a greater risk of feline obesity. Although cats are carnivores, high-caloric meat-based diets like beef and ham can also cause them to rapidly gain weight.

How to check if your cat is fat?

To be able to make sure that your cat is in shape or has grown overweight or obese, it is

important to be aware of the possible symptoms that are associated with feline obesity. Being able to read these symptoms can be extremely beneficial to timely determine if your cat requires professional veterinarian attention to help improve its weight, and avoid potential health risks.

- One of the most prominent symptoms of obesity in cats is showing signs of difficulty while climbing or jumping. Obese cats are unable to jump effortlessly to the high ground due to their higher body weight.
- They also show fewer bowel movements and are unable to relieve themselves as often as they should.
- Obese cats also lose their flexibility, which can restrict them from properly grooming themselves, especially around difficult spots, resulting in dirty, matted coats of fur.
- The loss of a visible waistline is also often associated with feline obesity.
- Lastly, performing the hand test to feel your kitty's rib cage can help you determine if your kitty is overweight or obese. Cat obesity can make it difficult for cat parents to be able to feel the ribcage under a thick layer of fat.

How to make your cat lose weight?

Mentioned below are some of the most effective ways in which you can help your little munchkin get in shape by losing excess weight.

- **Feeding schedule**

  Overeating in bigger portions and frequently eating are some of the most common causes of obesity in cats. Free feeding, or allowing your kitty to eat as much as they wish whenever they feel like has grown popular over the years, especially for cat parents who have to be away for a prolonged period. Convenient as it is, free feeding can encourage cats, who are unable to restrict themselves, to overeat. Instead, if you are looking to help your kitty in its journey of losing excess weight, determining an effective feeding schedule can go a long way. Working cat parents can opt for automatic food dispensers that can be scheduled to release cat food in controlled portions to prevent your furry munchkin from overeating.

- **Calorie-controlled diet**

  High-caloric meals, such as cat treats, beef and ham are loved by felines. But such foods can also significantly contribute to health concerns like feline obesity. Cats are foodies who appreciate fancy meals and are often unable to restrain themselves from overeating when offered delicious, high-calorie foods. Hence, it is also crucial to offer calorie-controlled food to your feline buddy, cut down on cat treats and limit the consumption of ham and beef to special occasions.

- **Exercise and physical activity**

  Exercise has been proven as one of the most efficient and accessible means of losing excess weight for almost all living beings, and is no different for our furry felines. In the wild, cats have to hunt down their prey for survival. As hunting takes a considerable effort, it burns excess calories and helps kitties stay fit. Since domestic cats do not hunt for their food, the lack of physical exercise can lead to feline obesity. But cats love to play, so you can use your playtime with your furry munchkin to increase their physical activity.

- **Professional help and medication**

  Certain medications like Bupropion naltrexone, Orlistat, and Liraglutide have been noted for their efficiency in curing feline obesity. However, as potent as they are, such over-the-counter medications are only to be administered if they have been professionally recommended by a veterinarian consulting a kitten weight chart. Furthermore, taking your fur baby for regular check-ups from a veterinarian can also help in an early diagnosis of obesity and other health risks.

Right cat food for weight loss process

A weight-reduction plan for overweight cats is the safest and most effective way of getting cats to lose the additional poundage and return to the average cat weight. Generally, cats undergoing a weight-reduction plan should be offered calorie-controlled food. Commercially available wet and dry cat food, such as Whiskas contain all the vital nutrients that cats require but are calorie-controlled. Furthermore, the caloric content of commercial cat food is available on the label, allowing cat parents to know exactly what and how much they are feeding their furballs.

While your precious feline friend is on a weight-reduction plan, it is also important to cut down its intake of cat treats, since cat treats have a rich caloric content and are meant for occasional use. Avoiding the use of meats like ham and beef which are rich in fats and fatty acids can also help cats lose weight. Follow kitten weight charts for reference.

Skinny Cat

Much like overweight and obese cats, underweight and malnourished cats often face the risk of contracting feline diseases due to a weakened immune system. Although most furry felines have lean bodies to support their active lifestyle, they still require sufficient amounts of protein and fat to be able to stay healthy. Though the concept of ideal weight in feline furries differs depending on its breed and age, a cat can be considered underweight if it does not meet the ideal weight of a cat for its age and breed. Hence, it is important to regularly look out if your cat is healthy and has an adequate body mass for its age.

The most common causes of thin cats are parasitic and bacterial diseases, stress and depression, which need to be treated before they cause your furry munchkin to lose too much weight.

How to check if your cat is underweight

Use the following ways to determine if your cat is underweight:

- Usually, a visual inspection can tell you if your cat is underweight since it takes a considerable toll on a cat’s body. Firstly, take a look at your cat’s waistline. Cats generally have a narrowing space between their rib cage and hind quarters which is a visual indication of having a waistline. If the narrowing space appears too closely drawn to the skin, it can be a sign of malnutrition.
- Furthermore, the hand test can also help cat parents to determine if their fur baby has the ideal cat weight. Use your fingers to feel around the cat’s rib cage. Ideally, the ribcage in cats can be felt under their fur. But if the ribcage distinctly pokes out, it is a

sign of malnutrition and being underweight in cats.
- The body condition score (BCS) can also help veterinarians conclude if a cat is healthy or underweight, or obese. Veterinarians often use BCS to grade cats on a scale of 1 to 9 depending on their appearance. Body condition scores higher than 6 means obesity while a score between 4 and 6 is considered ideal for cats. Body condition scores of 3 and lower can often indicate malnutrition and underweight cats.

How to make your cat gain weight

With these easy steps mentioned below, you can help your cat skinny gain weight.

- **A mix of wet and dry cat food**

  Although cats are often known for their unmatched love for food, they are picky eaters. Home-cooked food is one of the best options to look into if you are looking to help your cat put on some weight. However, not all cat parents are able to regularly cook for their munchkin, so Whiskas cat food is an easy alternative that ensures your feline buddy receives all essential nutrients and protein to help it gain weight. You can also try mixing the Whiskas wet and dry cat food together to make meal times more appetizing and to keep your kitty well-fed and hydrated. Available in several exotic flavours, Whiskas cat food can bring a delicious twist to your furry feline’s everyday meal.

- **Increase the number of meals**

  Increasing their everyday calorie intake can prove to be beneficial if you’re trying to help your cat gain weight. Increasing the number of meals and their portions can be helpful if you are wondering how to fatten a cat. Cats are also great foodies who appreciate a little variation in their everyday meals, so introducing different types of flavoured food to their everyday diet can go a long way. You can also encourage your cat to eat more by keeping its food bowl in an accessible place and making sure it is refilled from time to time. Additionally, warming up home-cooked food before serving can help bring out the delicious flavours, making it more appetizing.

- **Try hand feeding**

  Cats often lose weight when they are stressed and depressed, which causes them to turn down food even if they are hungry. In such cases, some additional warmth and affection can be just the thing your kitty needs to feel better and start eating once again. Hand feeding has been an effective measure that helps cat owners make sure their precious bundle of fur stays well fed, counter the potential causes of thin cats, and establish a deeper bond.

- **Weight gaining supplements**

  Commercially available weight gain supplements can also help cats gain weight within a short time. However, these supplements can also lead to obesity, and must only be used as an emergency measure recommended by veterinarians when other ways of helping cats gain weight have failed to show results.

Right Cat Food for weight gain process

Foods with a high-calorie content can prove beneficial if you are trying to fatten up your furry munchkin. Since cats are carnivores, a meat-based diet is the best option that provides cats with all the necessary nutrients while helping them gain weight. Generally, the ideal diet for cats to gain weight must contain over 52% protein, 45% fat, and 2-3% carbohydrates, along with other nutrients. Meats such as bacon, ham and beef have high caloric content and are also rich in fats and fatty acids, which can be ideal for underweight cats. Commercially available cat treats and wet cat foods are also known for their high caloric value and can help cats gain weight. Weight-gaining supplements for felines are available as over-the-counter medications that can help cats to gain weight rapidly but must be used only if advised by veterinarians.

FAQs on Cat Weight

All Questions

- All Questions

63

1. **What is spraying and marking in cats?**

   Male cats spraying is considered a vital part of feline communication. While most outdoor cats spray to mark territories, spraying in household cats is more instinctive. Female cat spraying and urine marking in cats are also for attracting mates.

2. **Do cats spray when happy?**

   While spraying can have several connotations, it does not generally indicate happiness in cats. Cat urine spraying is usually used for urine marking in cats to indicate territories, warding off predators, and attracting potential mates when in heat.

3. **How do I get my cat to stop spraying?**

   Since male cats spraying is mostly associated with non-neutered cats looking for a mate in heat, getting your cat spayed or neutered is a possible long-term solution. Additionally, veterinarians may recommend medications like Fluoxetine or Clomipramine with a high success rate.

4. **Is cat spraying the same as peeing?**

   Cat parents often wonder, why do cats spray? Contrary to popular belief, cat peeing and spraying are not the same. While cat pee involves your furry relieving itself, cat spray is more intentional to communicate certain things like marking territories.

5. **Why is my cat spraying?**

   Cats are known to spray for several reasons, such as cat marking their territories, warding away predators, or attracting potential mates when they are in heat. Cats under stress and anxiety are known to urine spray as well.

6. **How can I clean my cats' teeth naturally?**

   You can naturally clean your cat’s teeth using dental additives in their drinking water as cat gingivitis treatment that help get rid of microbial growth and tartar accumulation. Additionally, you can also consider getting eco-friendly biodegradable bamboo toothbrushes for cats!

7. **Do I need to brush my cat’s teeth with toothpaste?**

   Toothpaste for cats can be extremely beneficial in maintaining good oral health in cats. Other than preventing tooth decay, plaque build-up, and microbial actions that causes infection, feline toothpastes contain calcium, phosphates, and minerals to fortify and maintain their dental health.

8. **Is it too late to brush my cat’s teeth?**

   It is never too late to brush a cat’s teeth to maintain good cat dental health. If you suspect gingivitis in cats, with symptoms such as pale gums in cats, aversion to eating and drinking, or foul breath, it is important to visit a cat dentist.

9. **Are you supposed to brush your cat’s teeth?**

   Yes, cats over the age of 7 are prone to the risks of periodontal diseases and must maintain good dental health. Additionally, brushing a cat’s teeth regularly helps get rid of plaque and microbial growth, and avoid cat tooth decay.

10. **How harmful are fleas to cats?**

    Fleas in cats do not usually cause mortal harm, but can often lead to severe anaemia, weakness and allergies. Furthermore, cats can be exposed to the risks of tape worms in cats, flea allergy dermatitis, and open wounds if untreated.

11. **Are fleas killing my cat?**

    Although flea bites can cause significant irritation and skin injury to fur babies, they do not usually lead to life-threatening situations. However, having a flea infestation can cause cats to become anaemic, and can often prove lethal for smaller kittens.

12. **Can humans get fleas from cats?**

    Although rare, but humans can still get fleas from cats. Flea bites in humans can cause blisters and lesions at the location of the bite, severe cases may also lead to open wounds, infections, and flea-borne diseases like plague and typhus.

13. **How do you get rid of fleas on a cat?**

If your furry feline has fleas, you can consider giving them a sulphur bath or using flea and tick management shampoos to get rid of fleas in cats. Regularly brushing their coat using a flea comb can also prove beneficial.

14. **What to do if my cat is drinking too much water?**

Cats drinking unusually high amounts of cat water call for professional attention as it often indicates diabetes or hyperthyroidism. So, if your cat is drinking way too much cat water than necessary, it might be time for you to consult a veterinarian.

15. **Which is the best way to give water to a cat?**

While a shallow bowl with wider sides is the easiest and most common way of serving water to cats, having the best cat water fountain that offers continuous and clean, fresh running water can also encourage fur babies to drink more.

16. **How to give water to the cat?**

Cats prefer drinking from a water bowl or pail that is clean and shallow, and has wider sides. Additionally, having the best cat water fountain at home that offers continuous fresh running water can also encourage your kitty to drink more.

17. **Is it an emergency if my cat won't drink water?**

Cats can avoid drinking water once they've had their daily fill. However, cat won’t drink water when they are stressed or are suffering from an underlying health disorder such as feline UTI, which might call for an emergency.

18. **What kind of water should cats drink?**

Felines can regularly drink normal tap water or filtered water without facing any health concerns. However, if you want to go the extra mile by offering bottled water to your furry munchkin, spring water should be your top preference.

19. **Should cats be skinny?**

Being lightweight helps cats to effortlessly jump to high grounds, and flexibly pass through difficult terrains. However, cats are not supposed to be too skinny which restricts them from having a normal lifestyle. Being malnourished can cause health problems too.

20. **What is low weight for a cat?**

Adult cats with weights lower than 4 kg can be considered malnourished and underweight. Underweight cats have a visibly narrow frame and must be immediately treated to avoid the risks of health concerns like parasites, bacterial diseases, and so on.

21. **How much should a cat eat a day?**

The everyday caloric intake of furry felines depends on their age, breed, and their health conditions. An average caloric intake of 250 calories is sufficient for cats with a

weight of 4 to 5 kg and more for larger breeds.

22. **What is the normal weight for a cat?**

    The normal weight for a cat can vary depending on its age and breed. However, the normal weight for smaller cat breeds ranges between 4 to 4.5 kg, while the ideal cat weight for larger breeds is about 11 kg.

23. **What can I use to clean my kitten’s eyes?**

    Unless your furry munchkin is suffering from genuine eye problems, you might not need kitten eye care medications to clean your kitty’s eyes. Clean water and over-the-counter eye drops can be used for ensuring regular and optimal cat eye health.

24. **Should I wash my cat’s ears?**

    It is unwise to wash a cat’s ears, as it may clog their ear canal or damage the eardrum. Instead, schedule designated cat ear cleaning sessions and gently clean out the eardrums with cat ear cleansers and soft cotton balls.

25. **What can I use to clean my cat’s ears at home?**

    If you are cleaning your cat’s ears at home, you would need a towel, cat ear cleanser, some soft cotton balls or gauze, and cat ear cleansing wipes. Make sure to use cleansers that are designed specifically for feline use.

26. **How can I treat my cat’s skin naturally?**

    Giving your cat a bath using cat shampoo is a good option for cat skin care. But if you prefer a more natural solution, spraying lemon-infused water over their haircoat also helps in keeping the coat clean and getting rid of fleas.

27. **How do you take care of a cat’s skin?**

    While cats are excellent groomers themselves, proper cat skin care, such as brushing their coats regularly and bathing them on a monthly basis is also important to get rid of loose and matted fur, dirt, and dead skin cells.

28. **Do cats need vet checkups?**

    It is important to take cat to vet to get them checked for any underlying health disorders. Additionally, during the kitten check up, your veterinarian may inform you about any changes in your kitty’s diet or upcoming vaccinations that might be required.

29. **What tests do cats need yearly?**

    Feline leukaemia virus, feline infectious peritonitis, and feline immunodeficiency virus are some tests that might be suggested when you take cat to vet. In addition to the cat vet check up cost at the kitten check up, there may be additional charges if your cat needs tests.

30. **How often should a cat have a health check?**

    Wondering when to take cat to vet? Kittens may need a veterinarian appointment every three to four weeks. Now that you know when to take newborn kittens to vet, cats over four months of age need annual check-ups. Senior cats might require veterinary appointments every six months.

31. **How do I check if my cat is healthy?**

    It is important to know when to take cat to vet, by keeping an eye on them for possible symptoms of illness, such as frequent urination, diarrhoea or vomiting, change in behaviour, excessive shedding, nausea, lethargy, and loss of appetite.

32. **How do you take care of a newborn kitten without a mother?**

    It is crucial to learn how to care for a kitten, how do you bathe a kitten/how to care for a stray kitten and how to feed newborn kittens without a mother. You can feed them kitten formula instead of newborn kittens milk.

33. **How do you take care of a kitten for beginners?**

    Wondering how to care for newborn kittens, how do you take care of a stray kitten and how to feed newborn kittens? In addition to knowing when to bathe kittens and can I bathe my 1 month old kitten, you must look into their kitten bathing and eating habits and kitten sleeping schedules.

34. **How much do you feed a kitten?**

    Wondering how to feed kittens and how to care for a kitten? Kittens require a higher caloric intake when it comes to how to feed kittens. So, what to feed newborn kittens? Kittens over 6 weeks can be fed a cup of dry cat food every day.

35. **What is the best way to feed kittens?**

    Are you worried about how to care for a kitten or how to care for newborn kittens? In their infancy, kittens are completely dependent on newborn kittens milk as the source of nutrition. They gradually transition to solid food and water from newborn kittens milk.

36. **How to get rid of worms in cats naturally?**

    Foods like pumpkin seeds, chamomile, coconut, carrots, and apple cider vinegar can prove to be very effective against worm infections for your cat. But it is always advisable to visit a vet for a surer treatment against worm infection.

37. **How long does it take to get rid of worms in cats?**

    Worms can multiply in numbers at a rapid pace and can continue to do so even after the first dose of deworm cat medicine. Thus, the process of treatment for worm infection can last for a month to make sure not a single worm is left in your cart.

38. **What should I do if my cats have worms?**

If you suspect that your cats have worms, you should immediately take it to a vet. Administering medicines to your cat on your own can have a severe impact on your cat. Instead, you should always consult a vet for the treatment of worms.

39. **Can humans get worms from cats?**

Yes, humans can also get infected by cats. This is why it is always advised to wear gloves while feeding your cat, or cleaning its litter. If you use your bare hands, then avoid putting them in your eyes or mouth and clean them thoroughly.

40. **How do you know if a cat has worms?**

Different worms exhibit different structures. Thus, you can lookout for signs of them in the faeces of your pet cat. You can also be attentive to symptoms like diarrhoea, vomiting, weight loss, such as worms in cat vomit.

41. **What are the characteristic features of cat poisoning?**

Most fur babies are vulnerable to toxic items that can lead to poisoning. You can identify cat poisoning from symptoms like coughing, swelling or inflammations, excessive drooling and shedding, fever, seizure and twitching, loss of appetite, diarrhoea, increased thirst and urination, the cat keeps vomiting etc.

42. **What causes a cat to vomit food?**

There are several reasons you can find your cat throwing up food. While your cat vomits after eating, it often include harmless reasons like an excess of hairball, it might also include other serious reasons like a parasitic or bacterial infestation, indigestion or food allergies, pancreatitis, poisoning, stress and depression.

43. **How to treat a cat that won’t eat?**

If your cat is showing a strong aversion to food, but isn’t necessarily sick or vomiting, you can tempt your cat by offering food that has been warmed up, offering strong-smelling foods (like sardines), or hand feeding your cat.

44. **Why doesn’t the cat want to eat and vomit?**

Your fur kiddo can throw up due to several factors, the primary of which is a food allergy or indigestion. Your cats can also fall sick and refuse to eat due to other health concerns like parasitic or bacterial infestations. The cause of cat puking can also be digestive, renal or liver diseases.

45. **What to do when a cat vomits?**

If you find your cat throwing up, it is important to remove its food to avoid any further indigestion. You can also renew its water bowl, making sure your cat drinks fresh water and stays sufficiently hydrated throughout the period. Later, you can introduce low cooked fish or chicken to their diet, making sure they are offered in smaller quantities. If the cat vomited green, you must look for professional health and support

46. **How long does it take for a cat to heal from skin diseases?**

The time taken by a cat to heal from cat skin disease is often influenced by their age, lifestyle and the severity of their condition. Usually, cats can recover from most skin diseases within 8 to 10 weeks, after which the allergic signs disappear. However, if you suspect your cats have skin diseases, it is better to take them to a veterinarian rather than wait for them to heal on their own.

47. **Can cat scabies heal on their own?**

Scabies is caused by mites and fleas living on the skin of your furry friend. Unless appropriate initiations are taken in order to kill the mites, scabies cannot heal on its own. Once the mites have been killed and removed from your cat's body, topical medicines and ointments can be beneficial in treating scabies even faster.

48. **Why does my cat have scabs but no fleas?**

Scabs in cats do not always indicate mite or flea actions. Scabs can be caused by several other factors including environmental allergies, agents like debris, as well as due to an injury from a fight with other animals. Topical steroid creams are usually of help in treating scabs and reducing itchiness and discomfort.

49. **Why is my cat's skin dry and peeling?**

The dryness and peeling nature of a cat's skin can result from several reasons, including food allergies, environmental allergies, and even fungal actions. However, you can treat your cat by including more Omega-3, zinc, and fatty acids in their diet. Home remedies like apple cider vinegar and water spray are also helpful in treating dry and flaky skin.

50. **Can scabies in cats be cured?**

Yes, scabies in cats can be treated through topical medications and flea control treatments. Topical medications to treat scabies can be applied by injections, shampoo, or dips. In addition, your veterinarian can also suggest measures to kill the mites causing scabies, as well as antibiotics and anti-inflammatories to treat the skin conditions.

51. **What are contagious diseases for cats?**

Feline panleukopenia is one of the most contagious viral diseases in cats, which is spread through bodily fluids, fleas, faeces, as well as through contaminated blood, water bowls, litter boxes and clothing. It can also be passed on to kittens from an unvaccinated mother.

52. **What is the deadliest disease for cats?**

Though most cats have an innate resistance to diseases, some cats succumb to the deadliest diseases. Some of the most common cat sickness include feline leukaemia (which results in several health risks, ultimately attacking the immune system and bone marrow failure), feline Immunodeficiency virus (FIV, which attacks the immune system, making the cat susceptible to the most common infections and diseases)

53. **Can humans catch diseases from cats?**

Though human beings are not susceptible to cat-specific diseases, they can still get sick from having been in contact with sick cats. In addition, sick cats often carry harmful germs which can lead to potential health risks unless safety precautions are followed.

54. **What are the symptoms of a sick cat?**

If your cat is suffering from an ailment, here are some of the common symptoms that can help identify the diseases in cat. These symptoms often characterize themselves without any slight changes in the mood, rapid breathing and shortness of breath, I have just the noticeable weight and hair loss, vomiting and diarrhoea.

55. **What are the common cat diseases?**

Cats are easily susceptible to several diseases. Hence, it is important to be able to identify some of the most common diseases in cats. Some of the common cat diseases that can bring down your feline friend include leukaemia, Feline Immunodeficiency Virus (FIV), diabetes, heartworm, and more.

56. **How long does cat conjunctivitis last?**

Conjunctivitis is a common eye problem in cats that does not cause any lasting damage. Cat conjunctivitis, whether bacterial or viral, goes away by itself in weeks without the need for medical intervention or complex red eye in cats treatment.

57. **Will cat conjunctivitis go away by itself?**

Yes, cat conjunctivitis is one of the most common kinds of eye problem in cats that our felines can experience multiple times in their lives. However, conjunctivitis generally does not require external intervention as they subside within a short while.

58. **When should I worry about my cat's eye infection?**

Common cat's eye infections, such as conjunctivitis does not always call for red eye in cats treatment as they generally subside within weeks. However, severe cases must be treated with red eye in cats treatment like eye drop for feline furries.

59. **How can I treat my cat's eye infection?**

Cat's eye infections can be usually treated with topical antibacterial ointments and eye drop for cats. In addition to eye drop for cats, veterinarians can also recommend broad-spectrum antibiotics or anti-inflammatory drugs and other cat eye medicine as effective cat eye treatment.

60. **Are ear infections painful for cats?**

Although ear infections caused by mites on cats or cat yeast infection last for a couple of weeks, long-standing or recurrent yeast infections cat ear caused by mites on cats is painful, making it necessary to use proper cat ear infection treatment.

61. **How do you get rid of ear mites in cats?**

    Ear mites on cats are common causes with cases like cat has ear infections and cat yeast infection. Thoroughly clean the cat's ears with ear mite treatment for cats before applying topical medications and ointments to get rid of ear mites in cats, or when your cat has itchy ears.

62. **Is cat ear infection serious?**

    Although not all ear infections are serious and last only for weeks without the need for cat ear infection treatment or ear mite medicine for cats, long-lasting ear infections can pose a serious threat. Not to mention they cause discomfort.

63. **Can cat ear infections go away on their own?**

    Yes, ear infections usually go away within a couple of weeks, without ear mite medicine for cats being used or cat ear infection treatment being necessary, so there's no need to worry about treat ear mites in cats, or how to treat cat ear infections.
