Types Of Cat Worms, It's Causes, Symptoms And Treatment

Types Of Cat Worms, It's Causes, Symptoms And Treatment

It is very common for humans to visit a doctor in order to tackle the worms in their tummies. But, did you know that the furry friends around us can also face the same problem? Rather it is more commonly found in your pets, than in your own body. While we can easily express ourselves when anything is wrong with us, the same cannot be expected from our pets. Instead of letting them suffer through the pain, we can look out for signs of discomfort that can indicate the presence of worms in them. One of the most common signs of the presence of worms is the sudden loss of energy in your kitten. If your kitty loves jumping on your lap every time you're back home or doesn't let you work in peace because they need the entirety of your attention, then there's a huge problem if they suddenly start keeping to themselves.

There are many different types of worms in cats that can cause severe harm to your baby cat, like roundworms, tapeworms, hookworms, heartworms, etc. Roundworms and tapeworms have similar effects in kittens. They essentially prevent the normal growth of your cats and the digestive problems are constant. The excessive formation of gas due to roundworms creates a pot belly which is a source of great discomfort for your baby. Hookworms are often life-threatening for your little munchkin because they are known to

survive on blood. Thus, the constant sucking of blood is bound to cause anaemia. The symptoms of heartworms are often not physically manifested, but some common ones include vomiting and weight loss. Their creation is triggered by mosquito bites. Hence, you must keep your tiny ball of cuteness away from mosquitoes.

Among other things, if your pet cat is suffering from a loss of appetite, weight loss, or diarrhoea, then there is a definite manifestation of worms. If your fur baby is almost an adult, then the chances of risk are considerably lower. But there is no point in putting the life of your baby at stake. Instead, you should take them to a doctor to get checked. On the other hand, if your kitten is still very young, the consequences of worm infestation become a thousand times worse. This can be because kittens do not have a well-formed immunity system yet. Since there are not always clear signs of symptoms, you must take your pet to the vet for a regular check-up. The vet will examine the symptoms or get appropriate tests done to recognize the type of worms that is causing the infection. Their treatment will accordingly be done and very soon your furball will be back to being a playful bundle of happiness.

What are the different types of worms that are found in cats?

In most cases, cats can become infected with worms because their humans were not careful or hygienic enough and transmitted the bacteria to them. Thus, it is important to be aware of the different types of worms in order to handle them.

- **Roundworm**

Roundworms are types of worms in cats that look like pieces of noodles and are transmitted from other affected animals. Cats and dogs may leave their faeces that contain roundworms. These get mixed with the soil and may enter the stomach of your cat if they are not cleaned properly after taking a walk outside. Their symptoms include excessive vomiting, diarrhoea, loss of appetite, fatigue, and poor condition of fur. Almost all cases have reported signs of a potbelly due to the excessive formation of gas. Humans can also get infected by roundworms by ingesting the larvae eggs.

- **Tapeworm**

It is difficult to pinpoint symptoms of tapeworm in your adult cat. This is why a monthly check-up is necessary to ensure the well-being of your little ball of sunshine. In the case of kittens, tapeworms can cause drastic weight loss, discomfort around the anus, and vomiting. They look like small grains of rice and are almost always found in the faeces of infected animals through which they can infect other animals. It is advisable to keep your cat away from the faeces of other animals. As a form of cat worms, the tapeworm cannot start showing any effect in your kitten until it reaches the intestines. A huge accumulation of tapeworms in the intestines can cause a blockage that can mess up the digestive system and causes extreme discomfort. Cats

- **Heartworm**

The name itself informs you about the site of infection. One of the deadliest among cat worms is the heartworms that severely damages the blood vessels, heart, and lungs. Moreover, there are no specific symptoms of the infection of heartworms and can even

cause death without any prior notice. Some animals have reported symptoms of breathlessness, rapid beating of the heart, vomiting, etc. Since there is no cure for heartworms, the only way out is prevention from mosquito bites which is the primary causative agent of heartworm infection in cats.

- **Lung flukes**

Lung flukes are very rare so the chances of your little munchkin suffering from this type of worm cats are minimal. But that being said, the impact of lungworm infection is very serious and must be treated with care. If your kitten consumes contaminated water or other small animals that are infected with lungworms, the cat worm will find its way to the lungs and replicate there. The symptoms usually include excessive coughing, vomiting, or diarrhoea through which the worms are also expelled. These signs should not be confused with other health problems like pneumonia, or bronchitis. Instead, any minor physical issue should be consulted with a vet.

- **Hookworm**

Unlike other types of worms, the hookworms have no physical manifestation in cats that have grown quite a bit. But younger ones may suffer from intense diarrhoea, and loss of blood which can lead to anaemia. Their mechanism of hooking onto the inner lining of the intestines causes excessive internal bleeding which can prove to be hazardous. Hookworms are contracted from other infected animals that have dumped their faeces on the soil. Your pet cat can ingest the larvae from the soil or even get infected from the ones that have stuck to your feet when you were walking on the soil infested with hookworm larvae. Humans can also get infected with these types of worms in cats that can damage the skin and cause excessive itching.

- **Stress induced Alopecia**

If you are choosing to bring a fur baby home, you have to stick up with the amount of fur that will be found on every belonging of yours. From your furniture to the clothes you wear, hair from your pet cat can find its way to everything. Cats grooming themselves is not a cause of worry. What should make you worry is when your kitten starts losing so much fur that its skin coat looks skimpy. Cat Stress induced alopecia is often found in cats that are very anxious and restless. The stress causes them to lick themselves more than usual, causing the loss of hair. Consulting a vet is suggested so that they can advise how to treat the problem.

Preventive measures for worm cat infections

By sticking to these preventive measures, you can make sure that even if your cats have worms, they can enjoy a healthy, normal life.

- Keeping your surroundings clean and hygienic is the first step to ensuring a wormless kitten.
- Cleaning yourself and your kitten thoroughly after a day out is necessary to prevent infections.
- Take your cat to a vet on a monthly basis for check-ups.
- Make sure your pet kitten is not on the hunt for other smaller animals that may be infected with cat worms.

- Keep a close eye on their faeces to find any signs of worms in cats and also worms in cat vomit.
- Including preventive medicines prescribed by a vet with your cat's daily meals.
- Conducting a faecal test, or regular deworming can also prove to be very effective in preventing worm infections in your precious fur babies.

Treatment for worm infections

- Taking your furry little friend through the deworm cats process can effectively kill worms in cats.
- Prescribed medications can be administered through a number of doses of medicines that will guarantee the end of worms. A single dose is not effective because it is ineffective in preventing another bout of infection.
- Performing an endoscopy and swift removal of the worms that are found on the stomach lining is an effective worm treatment for cats. This is only for the types of worms in cats that fix themselves around the intestines like roundworms, tapeworms, and hookworms.
- Injecting medicine directly through the skin of your cat is also effective worm treatment for cats and has a quicker reaction on the cat worms.

Medicine for worm infections

- Pencing is extremely effective when it comes to intestinal worms such as roundworms and tapeworms.
- Drontal Plus (pyrantel, praziquantel, fenbendazole) can be administered for infections from hookworms, whipworms and other kinds of cat worms in the intestine.
- Praziquantel is directly injected into the skin of your fur baby. It paralyzes the tapeworms so that they can no longer stick to the intestines and passes out of the body through the faeces
- Pyrantel pamoate or Ivermectin is effective against the condition of Physaloptera spp. and the dosage needs to be taken twice in two or three weeks.
- Levamisole is an immediate treatment solution for Ollulanus tricuspis.

Remember that your little munchkin is like your own baby, hence, do not use any medicines for their treatment before consulting a vet.

Preventing worm infections from reoccurring

- Keeping your home hygienic and cleaning your pet's area of litter to keep it free from germs is the first step to making sure there is not another bout of infection.
- Take your pet cat to the vet for regular deworm cat sessions.
- Keep your cat away from the faeces of other animals while taking them out.
- Cleaning them thoroughly after coming back home.
- Keep a lookout for any minor sign of discomfort that may signal the beginning of another infection.
- Not delaying the treatment of any physical ailment that your kitten is suffering from.
- Put your kitten on a healthy diet to increase their immunity, rebuild their appetite, and regain their energy after recovering from a worm infection.

FAQ on Worms in Cats

All Questions

- All Questions

63

1. **What is spraying and marking in cats?**

   Male cats spraying is considered a vital part of feline communication. While most outdoor cats spray to mark territories, spraying in household cats is more instinctive. Female cat spraying and urine marking in cats are also for attracting mates.

2. **Do cats spray when happy?**

   While spraying can have several connotations, it does not generally indicate happiness in cats. Cat urine spraying is usually used for urine marking in cats to indicate territories, warding off predators, and attracting potential mates when in heat.

3. **How do I get my cat to stop spraying?**

   Since male cats spraying is mostly associated with non-neutered cats looking for a mate in heat, getting your cat spayed or neutered is a possible long-term solution. Additionally, veterinarians may recommend medications like Fluoxetine or Clomipramine with a high success rate.

4. **Is cat spraying the same as peeing?**

   Cat parents often wonder, why do cats spray? Contrary to popular belief, cat peeing and spraying are not the same. While cat pee involves your furry relieving itself, cat spray is more intentional to communicate certain things like marking territories.

5. **Why is my cat spraying?**

   Cats are known to spray for several reasons, such as cat marking their territories, warding away predators, or attracting potential mates when they are in heat. Cats under stress and anxiety are known to urine spray as well.

6. **How can I clean my cats' teeth naturally?**

   You can naturally clean your cat’s teeth using dental additives in their drinking water as cat gingivitis treatment that help get rid of microbial growth and tartar accumulation. Additionally, you can also consider getting eco-friendly biodegradable bamboo toothbrushes for cats!

7. **Do I need to brush my cat’s teeth with toothpaste?**

   Toothpaste for cats can be extremely beneficial in maintaining good oral health in

cats. Other than preventing tooth decay, plaque build-up, and microbial actions that causes infection, feline toothpastes contain calcium, phosphates, and minerals to fortify and maintain their dental health.

8. **Is it too late to brush my cat’s teeth?**

   It is never too late to brush a cat’s teeth to maintain good cat dental health. If you suspect gingivitis in cats, with symptoms such as pale gums in cats, aversion to eating and drinking, or foul breath, it is important to visit a cat dentist.

9. **Are you supposed to brush your cat’s teeth?**

   Yes, cats over the age of 7 are prone to the risks of periodontal diseases and must maintain good dental health. Additionally, brushing a cat’s teeth regularly helps get rid of plaque and microbial growth, and avoid cat tooth decay.

10. **How harmful are fleas to cats?**

    Fleas in cats do not usually cause mortal harm, but can often lead to severe anaemia, weakness and allergies. Furthermore, cats can be exposed to the risks of tape worms in cats, flea allergy dermatitis, and open wounds if untreated.

11. **Are fleas killing my cat?**

    Although flea bites can cause significant irritation and skin injury to fur babies, they do not usually lead to life-threatening situations. However, having a flea infestation can cause cats to become anaemic, and can often prove lethal for smaller kittens.

12. **Can humans get fleas from cats?**

    Although rare, but humans can still get fleas from cats. Flea bites in humans can cause blisters and lesions at the location of the bite, severe cases may also lead to open wounds, infections, and flea-borne diseases like plague and typhus.

13. **How do you get rid of fleas on a cat?**

    If your furry feline has fleas, you can consider giving them a sulphur bath or using flea and tick management shampoos to get rid of fleas in cats. Regularly brushing their coat using a flea comb can also prove beneficial.

14. **What to do if my cat is drinking too much water?**

    Cats drinking unusually high amounts of cat water call for professional attention as it often indicates diabetes or hyperthyroidism. So, if your cat is drinking way too much cat water than necessary, it might be time for you to consult a veterinarian.

15. **Which is the best way to give water to a cat?**

    While a shallow bowl with wider sides is the easiest and most common way of serving water to cats, having the best cat water fountain that offers continuous and clean, fresh running water can also encourage fur babies to drink more.

16. **How to give water to the cat?**

    Cats prefer drinking from a water bowl or pail that is clean and shallow, and has wider sides. Additionally, having the best cat water fountain at home that offers continuous fresh running water can also encourage your kitty to drink more.

17. **Is it an emergency if my cat won't drink water?**

    Cats can avoid drinking water once they've had their daily fill. However, cat won’t drink water when they are stressed or are suffering from an underlying health disorder such as feline UTI, which might call for an emergency.

18. **What kind of water should cats drink?**

    Felines can regularly drink normal tap water or filtered water without facing any health concerns. However, if you want to go the extra mile by offering bottled water to your furry munchkin, spring water should be your top preference.

19. **Should cats be skinny?**

    Being lightweight helps cats to effortlessly jump to high grounds, and flexibly pass through difficult terrains. However, cats are not supposed to be too skinny which restricts them from having a normal lifestyle. Being malnourished can cause health problems too.

20. **What is low weight for a cat?**

    Adult cats with weights lower than 4 kg can be considered malnourished and underweight. Underweight cats have a visibly narrow frame and must be immediately treated to avoid the risks of health concerns like parasites, bacterial diseases, and so on.

21. **How much should a cat eat a day?**

    The everyday caloric intake of furry felines depends on their age, breed, and their health conditions. An average caloric intake of 250 calories is sufficient for cats with a weight of 4 to 5 kg and more for larger breeds.

22. **What is the normal weight for a cat?**

    The normal weight for a cat can vary depending on its age and breed. However, the normal weight for smaller cat breeds ranges between 4 to 4.5 kg, while the ideal cat weight for larger breeds is about 11 kg.

23. **What can I use to clean my kitten’s eyes?**

    Unless your furry munchkin is suffering from genuine eye problems, you might not need kitten eye care medications to clean your kitty’s eyes. Clean water and over-the-counter eye drops can be used for ensuring regular and optimal cat eye health.

24. **Should I wash my cat’s ears?**

It is unwise to wash a cat’s ears, as it may clog their ear canal or damage the eardrum. Instead, schedule designated cat ear cleaning sessions and gently clean out the eardrums with cat ear cleansers and soft cotton balls.

25. **What can I use to clean my cat’s ears at home?**

    If you are cleaning your cat’s ears at home, you would need a towel, cat ear cleanser, some soft cotton balls or gauze, and cat ear cleansing wipes. Make sure to use cleansers that are designed specifically for feline use.

26. **How can I treat my cat’s skin naturally?**

    Giving your cat a bath using cat shampoo is a good option for cat skin care. But if you prefer a more natural solution, spraying lemon-infused water over their haircoat also helps in keeping the coat clean and getting rid of fleas.

27. **How do you take care of a cat’s skin?**

    While cats are excellent groomers themselves, proper cat skin care, such as brushing their coats regularly and bathing them on a monthly basis is also important to get rid of loose and matted fur, dirt, and dead skin cells.

28. **Do cats need vet checkups?**

    It is important to take cat to vet to get them checked for any underlying health disorders. Additionally, during the kitten check up, your veterinarian may inform you about any changes in your kitty’s diet or upcoming vaccinations that might be required.

29. **What tests do cats need yearly?**

    Feline leukaemia virus, feline infectious peritonitis, and feline immunodeficiency virus are some tests that might be suggested when you take cat to vet. In addition to the cat vet check up cost at the kitten check up, there may be additional charges if your cat needs tests.

30. **How often should a cat have a health check?**

    Wondering when to take cat to vet? Kittens may need a veterinarian appointment every three to four weeks. Now that you know when to take newborn kittens to vet, cats over four months of age need annual check-ups. Senior cats might require veterinary appointments every six months.

31. **How do I check if my cat is healthy?**

    It is important to know when to take cat to vet, by keeping an eye on them for possible symptoms of illness, such as frequent urination, diarrhoea or vomiting, change in behaviour, excessive shedding, nausea, lethargy, and loss of appetite.

32. **How do you take care of a newborn kitten without a mother?**

    It is crucial to learn how to care for a kitten, how do you bathe a kitten/how to care for

a stray kitten and how to feed newborn kittens without a mother. You can feed them kitten formula instead of newborn kittens milk.

33. **How do you take care of a kitten for beginners?**

    Wondering how to care for newborn kittens, how do you take care of a stray kitten and how to feed newborn kittens? In addition to knowing when to bathe kittens and can I bathe my 1 month old kitten, you must look into their kitten bathing and eating habits and kitten sleeping schedules.

34. **How much do you feed a kitten?**

    Wondering how to feed kittens and how to care for a kitten? Kittens require a higher caloric intake when it comes to how to feed kittens. So, what to feed newborn kittens? Kittens over 6 weeks can be fed a cup of dry cat food every day.

35. **What is the best way to feed kittens?**

    Are you worried about how to care for a kitten or how to care for newborn kittens? In their infancy, kittens are completely dependent on newborn kittens milk as the source of nutrition. They gradually transition to solid food and water from newborn kittens milk.

36. **How to get rid of worms in cats naturally?**

    Foods like pumpkin seeds, chamomile, coconut, carrots, and apple cider vinegar can prove to be very effective against worm infections for your cat. But it is always advisable to visit a vet for a surer treatment against worm infection.

37. **How long does it take to get rid of worms in cats?**

    Worms can multiply in numbers at a rapid pace and can continue to do so even after the first dose of deworm cat medicine. Thus, the process of treatment for worm infection can last for a month to make sure not a single worm is left in your cart.

38. **What should I do if my cats have worms?**

    If you suspect that your cats have worms, you should immediately take it to a vet. Administering medicines to your cat on your own can have a severe impact on your cat. Instead, you should always consult a vet for the treatment of worms.

39. **Can humans get worms from cats?**

    Yes, humans can also get infected by cats. This is why it is always advised to wear gloves while feeding your cat, or cleaning its litter. If you use your bare hands, then avoid putting them in your eyes or mouth and clean them thoroughly.

40. **How do you know if a cat has worms?**

    Different worms exhibit different structures. Thus, you can lookout for signs of them in the faeces of your pet cat. You can also be attentive to symptoms like diarrhoea, vomiting, weight loss, such as worms in cat vomit.

41. **What are the characteristic features of cat poisoning?**

    Most fur babies are vulnerable to toxic items that can lead to poisoning. You can identify cat poisoning from symptoms like coughing, swelling or inflammations, excessive drooling and shedding, fever, seizure and twitching, loss of appetite, diarrhoea, increased thirst and urination, the cat keeps vomiting etc.

42. **What causes a cat to vomit food?**

    There are several reasons you can find your cat throwing up food. While your cat vomits after eating, it often include harmless reasons like an excess of hairball, it might also include other serious reasons like a parasitic or bacterial infestation, indigestion or food allergies, pancreatitis, poisoning, stress and depression.

43. **How to treat a cat that won’t eat?**

    If your cat is showing a strong aversion to food, but isn’t necessarily sick or vomiting, you can tempt your cat by offering food that has been warmed up, offering strong-smelling foods (like sardines), or hand feeding your cat.

44. **Why doesn’t the cat want to eat and vomit?**

    Your fur kiddo can throw up due to several factors, the primary of which is a food allergy or indigestion. Your cats can also fall sick and refuse to eat due to other health concerns like parasitic or bacterial infestations. The cause of cat puking can also be digestive, renal or liver diseases.

45. **What to do when a cat vomits?**

    If you find your cat throwing up, it is important to remove its food to avoid any further indigestion. You can also renew its water bowl, making sure your cat drinks fresh water and stays sufficiently hydrated throughout the period. Later, you can introduce low cooked fish or chicken to their diet, making sure they are offered in smaller quantities. If the cat vomited green, you must look for professional health and support

46. **How long does it take for a cat to heal from skin diseases?**

    The time taken by a cat to heal from cat skin disease is often influenced by their age, lifestyle and the severity of their condition. Usually, cats can recover from most skin diseases within 8 to 10 weeks, after which the allergic signs disappear. However, if you suspect your cats have skin diseases, it is better to take them to a veterinarian rather than wait for them to heal on their own.

47. **Can cat scabies heal on their own?**

    Scabies is caused by mites and fleas living on the skin of your furry friend. Unless appropriate initiations are taken in order to kill the mites, scabies cannot heal on its own. Once the mites have been killed and removed from your cat's body, topical medicines and ointments can be beneficial in treating scabies even faster.

48. **Why does my cat have scabs but no fleas?**

Scabs in cats do not always indicate mite or flea actions. Scabs can be caused by several other factors including environmental allergies, agents like debris, as well as due to an injury from a fight with other animals. Topical steroid creams are usually of help in treating scabs and reducing itchiness and discomfort.

49. Why is my cat's skin dry and peeling?

The dryness and peeling nature of a cat's skin can result from several reasons, including food allergies, environmental allergies, and even fungal actions. However, you can treat your cat by including more Omega-3, zinc, and fatty acids in their diet. Home remedies like apple cider vinegar and water spray are also helpful in treating dry and flaky skin.

50. Can scabies in cats be cured?

Yes, scabies in cats can be treated through topical medications and flea control treatments. Topical medications to treat scabies can be applied by injections, shampoo, or dips. In addition, your veterinarian can also suggest measures to kill the mites causing scabies, as well as antibiotics and anti-inflammatories to treat the skin conditions.

51. What are contagious diseases for cats?

Feline panleukopenia is one of the most contagious viral diseases in cats, which is spread through bodily fluids, fleas, faeces, as well as through contaminated blood, water bowls, litter boxes and clothing. It can also be passed on to kittens from an unvaccinated mother.
