Who doesn't love playing with their cats? However, cat skin diseases must not be the reason holding you back from giving your fuzzy friends all the cuddles and pets.

Like any other creature to have existed on Earth, skin is the largest organ in cats and serves several important purposes. However, if you see your furry little munchkin scratching and biting itself continuously, it might be an indication that they are in discomfort.

Depending on their breed, cats can be differentiated based on their skin and coat. Most cats have an average to long coat, serving several important purposes. Not only does it make your furry friend appear cute, but your cat's skin also serves a vital role in keeping up their everyday activities, health, and lifestyle.

Primarily, the dermal layer protects your cat against damage from most external agents like debris and chemicals. Furthermore, it plays an important role in sustaining them against harsh environments like heat and cold by regulating the temperature of their body through the process of thermoregulation. In addition, the skin in cats is an important part of their immune system, keeping away potential diseases like infections and bacterial actions.

The skin in cats also acts as a reserve for nutrients including protein (in fact, the hair present on the cat's skin accounts for almost 30% of their everyday protein consumption), collagen fibres, enzymes, and amino acids. Hence, as important as the skin is to your cat's well-being, it is equally urgent to make sure your cat is free from any dermatological

diseases.

Parasitic reaction is one of the most common causes of cat skin conditions and discomfort on the skin, which can often take a severe form, leading to hair loss and other conditions. Fleas, too, are a common reason behind skin pain cats suffer from. Fleas are small parasites that often latch onto the skin of cats, causing discomfort and itches.

In addition, cat skin conditions can also arise from injuries, filth, and other [cat diseases](#). If your cat has been bitten by other animals, it is a wise idea to get it checked by a veterinarian. If left unchecked, the bite can lead to skin conditions, which can worsen over time, leading to hair loss, deterioration in general health, and other noticeable dermatological concerns.

You can find out more about the common cat skin conditions, how to identify them and make sure your munchkin gets the healthcare treatment it deserves.

Skin problems in cats

Here are some of the common types of feline skin conditions you must keep an eye out for:

- **Acne:**

Acne is one of the most common kitten skin problems that is caused by bacterial growth, as well as by increased production of keratin (a protein found in the skin), which can block the hair follicles. Acne in cats is usually characterised by pimples and blackheads that appear under the lips and the chin. Acne in cats can cause them to scratch the infected area to help with the cat skin pain. Acne in cats can be treated with medicated shampoos, ointments and warm compresses. In addition, Omega-3 can be effectively used to improve skin health and battle acne. Topical antibiotics available as creams and gels can also be applied to help with the swelling and irritation.

- **Scabies:**

Cats are often susceptible to skin cat diseases like scabies, which is predominantly caused by mites. Mites that burrow into a cat's skin can infect the skin, causing inflammation, swelling and loss of hair. If it isn't uncomfortable enough, excessive scratching can worsen the condition, leading to scabs and redness. If your cat is seen scratching itself constantly, it is a good idea to plan a visit to the veterinarian to get your furry friend diagnosed, as mites are usually invisible unless viewed through a microscope. Scabies in cats, however, is easily treatable through topical medications and flea control treatments. In addition, it is better to get your cat fresh new bedding and keep it away from other pets if it has been diagnosed with scabies.

- **Ear mites**

Ear mites are common cat skin diseases. Though ear mites are often found in cats of all ages, younger cats, especially kittens, are often prone to skin conditions caused by ear mites. If exposed to ear mites, your furry friend will tend to scratch and lick the

affected area to relieve itself from the itching and discomfort. However, excessive scratching to areas as sensitive as ears can cause lasting damage, so it is important to get your cat properly treated for ear mites if the suspicion arises. Topical treatments like systemic moxidectin, ivermectin and selamectin have also shown effectiveness against ear mites. Ear mites can also cause inflammation in the ear, often leading to bacterial infections. A veterinarian can suggest cleaning your cat's ears with appropriate cleaning solutions to help the condition.

- **Ticks:**

Ticks are a serious skin problem for cats, and can also be caused by fleas. Unless treated appropriately, ticks can take a severe form over time, leading to Lyme disease and babesiosis. Cat ticks are blood-sucking parasites often found in outdoor cats. If your cat has a tendency to go out on an adventure outdoors, it is important to keep an eye out for ticks. Thankfully, cat ticks are easy to spot due to their bigger size. You can easily check your cat for ticks by running your hand through their coat. A tick can be felt as a small bump against the skin of your cat. Ticks in cats can manifest as concerning health problems, so giving your cat appropriate preventive measures will ensure them a fighting chance against ticks. Flea prevention treatments are usually administered through the skin by veterinarians.

- **Environmental allergies:**

Environmental allergies are among the most common causes of cat skin diseases. Cats are usually sensitive to contact with several everyday items, which can cause cat skin pain and discomfort. Environmental agents that your cat might be susceptible to can include certain chemicals used in the household, pollen, grass, dust, or even food. Environmental allergies can cause your cat to continuously groom itself to get rid of any foreign particles or help with the skin pain cats experience. While giving your cat a bath can be effective in getting rid of general dirt and filth, observing your cat for signs of discomfort can be helpful in identifying any skin conditions that are bothering them.

- **Stress-induced Alopecia:**

Stress-induced Alopecia is an occurrence caused by a sudden change in your furry friend's behavioural patterns, often an indication of emotional or physiological distress in them. Cats are curious creatures, but sudden changes to their immediate environment can cause them significant stress. Stress-induced Alopecia in cats can result in increased shedding, or thinning of the coat in the stomach and back from excessive grooming. You can plan a visit to your vet to get your cat checked, as well as to discuss viable solutions. Usually, catnips and pheromone plug-ins are effective in relieving stress and anxiety, and taking necessary precautions against stressful environments can help treat hair loss.

- **Food allergies:**

Food allergies are common reasons behind cat skin problems. Infections and allergies in cats triggered by food and eating disorders are often characterised by irritations

around the head, neck and back. Skin problems in cats arising out of food allergies can be linked to certain proteins and carbohydrates present in the cat's diet. Cats require a specific dietary protein to continue with their usual lifestyle. So, to treat your cat for kitten skin 8 caused by food allergies, it is important to identify the component that triggers any food allergy in your cat, and gradually eliminate it from the cat's usual diet.

- **Abscess**

An abscess is a skin problem commonly found in outdoor cats, as well as house cats allowed to visit the outdoors. Abscesses are usually caused by physical injuries, as well as bites and scratches from other animals and cats. Cats who have not been neutered are prone to such injuries, which can cause significant discomfort and itching. Furthermore, abscesses caused by injuries leave behind an open wound through which bacteria can enter, causing other diseases and health issues. Open wounds can also get infected by bacterial actions, forming pus-filled wounds that require immediate medical attention. To treat a cat with an abscess, it is important to get professional care from a veterinarian and follow healthcare protocols and medications.

- **Fungal Infection:**

Your furry friend is also vulnerable to fungal actions, which might require professional help. Fungal infections are highly contagious and can be spread to humans and other animals, so it is important to ensure appropriate precautions before treating a cat diagnosed with fungal infections. Fungal infections in cats are usually identified through raised red circles that can thicken and form crusts. Fungal infections are accompanied by excessive shedding from the affected area, so it is important to clean and replace your cat's bedding to prevent mould spores from spreading. Fungal infections are best treated by professionals, so remember to consult your veterinarian if you suspect a fungal infection in your cat.

- **Endocrine Dermatosis:**

Endocrine Dermatosis is a cat skin infection caused by hormonal imbalances. Cats suffering from endocrine dermatosis often display symptoms like a dry coat, increased hair loss, itching, and dandruff. This skin condition can prove difficult to detect, and may require your veterinarian to run several tests to come to a final diagnosis. Hormonal imbalances that cause endocrine dermatosis in cats can be treated by spaying or neutering the cat, as well as by using topical medications and prescription shampoos.

General signs of cat skin problems

There are several reasons for which your cats have skin diseases, each characterised by individual symptoms. However. Given below are the general signs of cat skin problems that can help you identify and get your furry friend the appropriate treatment:

- **Hair loss**

Hair loss and excessive shedding are the most obvious signs of skin problems in cats. Keep an eye out for your feline friend developing a bald patch, and consult healthcare providers if necessary.

- **Itchy skin**

Itchy skin, alongside hair loss, is a common sign of cat skin disease. Itchy skin, accompanied by inflammations, can be a potential cause of discomfort for your cat, which can lead to excessive grooming to avoid the skin pain cats face or changes in their behavioural patterns.

- **Sores**

Sores and scabs can indicate serious skin conditions that require immediate medical attention. Open wounds from sores and scabs run the risk of bacterial contamination and must be treated immediately to avoid any further health concerns.

In addition, rashes, flaky and dry skin, skin tags and lumps are other noticeable signs of skin problems in cats.

Treatment of skin problems

If your cats have skin diseases, here are some home remedies to easily treat them:

- **Tea bath**

Tea baths have been proven effective against cat skin problems, and are known to alleviate skin irritations and itching. Your feline friend can also enjoy a nice relaxing bath from chamomile, calendula and green tea, popular for their soothing properties. It also helps in curing several types of cat skin issues.

- **Apple cider vinegar and water spray**

Cats suffering from flaky and itchy skin can be comforted by a thorough spray using a solution containing apple cider vinegar and water. It also helps with skin allergies and rashes.

- **Coconut oil**

Coconut oil is a popular home remedy for skin problems in cats due to its high content of antibacterial and antifungal properties. It can relieve the impacts of infections, allergies and insect bites.

Serious skin conditions, however, may require professional care and treatment through antibiotics, topical medications and ointments, and more.

How Whiskas products help to prevent skin cat diseases

Whiskas products have grown popular among cat parents due to their high antibacterial and antifungal content that boosts your furry friend's immune system, making them more resistant to not just cat skin infection, but almost all other health issues. [Whiskas cat food products](#) are full of digestible protein components that help your little furball grow and shake off any disease-causing bacteria. It is also packed with calcium, phosphorus, antioxidants and other essential vitamins to make sure your cat leads a healthy life and stays in great shape. Whiskas 1+ has been specifically designed for adult cats to give them all the energy to lead a life of adventures and fun. Whiskas wet food gives them all essential nutrients and keeps them hydrated, ensuring them a healthy skin free from rashes, hair loss and other skin cat diseases.

FAQ on skin problems in Cats

- [All Questions](#)

63

1. What is spraying and marking in cats?

Male cats spraying is considered a vital part of feline communication. While most outdoor cats spray to mark territories, spraying in household cats is more instinctive. Female cat spraying and urine marking in cats are also for attracting mates.

2. Do cats spray when happy?

While spraying can have several connotations, it does not generally indicate happiness in cats. Cat urine spraying is usually used for urine marking in cats to indicate territories, warding off predators, and attracting potential mates when in heat.

3. How do I get my cat to stop spraying?

Since male cats spraying is mostly associated with non-neutered cats looking for a mate in heat, getting your cat spayed or neutered is a possible long-term solution. Additionally, veterinarians may recommend medications like Fluoxetine or Clomipramine with a high success rate.

4. Is cat spraying the same as peeing?

Cat parents often wonder, why do cats spray? Contrary to popular belief, cat peeing and spraying are not the same. While cat pee involves your furry relieving itself, cat spray is more intentional to communicate certain things like marking territories.

5. Why is my cat spraying?

Cats are known to spray for several reasons, such as cat marking their territories, warding away predators, or attracting potential mates when they are in heat. Cats under stress and anxiety are known to urine spray as well.

6. How can I clean my cats' teeth naturally?

You can naturally clean your cat's teeth using dental additives in their drinking water as cat gingivitis treatment that help get rid of microbial growth and tartar accumulation. Additionally, you can also consider getting eco-friendly biodegradable bamboo toothbrushes for cats!

7. Do I need to brush my cat's teeth with toothpaste?

Toothpaste for cats can be extremely beneficial in maintaining good oral health in cats. Other than preventing tooth decay, plaque build-up, and microbial actions that causes infection, feline toothpastes contain calcium, phosphates, and minerals to fortify and maintain their dental health.

8. Is it too late to brush my cat's teeth?

It is never too late to brush a cat's teeth to maintain good cat dental health. If you suspect gingivitis in cats, with symptoms such as pale gums in cats, aversion to eating and drinking, or foul breath, it is important to visit a cat dentist.

9. Are you supposed to brush your cat's teeth?

Yes, cats over the age of 7 are prone to the risks of periodontal diseases and must maintain good dental health. Additionally, brushing a cat's teeth regularly helps get rid of plaque and microbial growth, and avoid cat tooth decay.

10. How harmful are fleas to cats?

Fleas in cats do not usually cause mortal harm, but can often lead to severe anaemia, weakness and allergies. Furthermore, cats can be exposed to the risks of tape worms

in cats, flea allergy dermatitis, and open wounds if untreated.

11. Are fleas killing my cat?

Although flea bites can cause significant irritation and skin injury to fur babies, they do not usually lead to life-threatening situations. However, having a flea infestation can cause cats to become anaemic, and can often prove lethal for smaller kittens.

12. Can humans get fleas from cats?

Although rare, but humans can still get fleas from cats. Flea bites in humans can cause blisters and lesions at the location of the bite, severe cases may also lead to open wounds, infections, and flea-borne diseases like plague and typhus.

13. How do you get rid of fleas on a cat?

If your furry feline has fleas, you can consider giving them a sulphur bath or using flea and tick management shampoos to get rid of fleas in cats. Regularly brushing their coat using a flea comb can also prove beneficial.

14. What to do if my cat is drinking too much water?

Cats drinking unusually high amounts of cat water call for professional attention as it often indicates diabetes or hyperthyroidism. So, if your cat is drinking way too much cat water than necessary, it might be time for you to consult a veterinarian.

15. Which is the best way to give water to a cat?

While a shallow bowl with wider sides is the easiest and most common way of serving water to cats, having the best cat water fountain that offers continuous and clean, fresh running water can also encourage fur babies to drink more.

16. How to give water to the cat?

Cats prefer drinking from a water bowl or pail that is clean and shallow, and has wider sides. Additionally, having the best cat water fountain at home that offers continuous fresh running water can also encourage your kitty to drink more.

17. Is it an emergency if my cat won't drink water?

Cats can avoid drinking water once they've had their daily fill. However, cat won't drink water when they are stressed or are suffering from an underlying health disorder

such as feline UTI, which might call for an emergency.

18. What kind of water should cats drink?

Felines can regularly drink normal tap water or filtered water without facing any health concerns. However, if you want to go the extra mile by offering bottled water to your furry munchkin, spring water should be your top preference.

19. Should cats be skinny?

Being lightweight helps cats to effortlessly jump to high grounds, and flexibly pass through difficult terrains. However, cats are not supposed to be too skinny which restricts them from having a normal lifestyle. Being malnourished can cause health problems too.

20. What is low weight for a cat?

Adult cats with weights lower than 4 kg can be considered malnourished and underweight. Underweight cats have a visibly narrow frame and must be immediately treated to avoid the risks of health concerns like parasites, bacterial diseases, and so on.

21. How much should a cat eat a day?

The everyday caloric intake of furry felines depends on their age, breed, and their health conditions. An average caloric intake of 250 calories is sufficient for cats with a weight of 4 to 5 kg and more for larger breeds.

22. What is the normal weight for a cat?

The normal weight for a cat can vary depending on its age and breed. However, the normal weight for smaller cat breeds ranges between 4 to 4.5 kg, while the ideal cat weight for larger breeds is about 11 kg.

23. What can I use to clean my kitten's eyes?

Unless your furry munchkin is suffering from genuine eye problems, you might not need kitten eye care medications to clean your kitty's eyes. Clean water and over-the-counter eye drops can be used for ensuring regular and optimal cat eye health.

Should I wash my cat's ears?

It is unwise to wash a cat's ears, as it may clog their ear canal or damage the eardrum. Instead, schedule designated cat ear cleaning sessions and gently clean out the eardrums with cat ear cleansers and soft cotton balls.

25. What can I use to clean my cat's ears at home?

If you are cleaning your cat's ears at home, you would need a towel, cat ear cleanser, some soft cotton balls or gauze, and cat ear cleansing wipes. Make sure to use cleansers that are designed specifically for feline use.

26. How can I treat my cat's skin naturally?

Giving your cat a bath using cat shampoo is a good option for cat skin care. But if you prefer a more natural solution, spraying lemon-infused water over their haircoat also helps in keeping the coat clean and getting rid of fleas.

27. How do you take care of a cat's skin?

While cats are excellent groomers themselves, proper cat skin care, such as brushing their coats regularly and bathing them on a monthly basis is also important to get rid of loose and matted fur, dirt, and dead skin cells.

28. Do cats need vet checkups?

It is important to take cat to vet to get them checked for any underlying health disorders. Additionally, during the kitten check up, your veterinarian may inform you about any changes in your kitty's diet or upcoming vaccinations that might be required.

29. What tests do cats need yearly?

Feline leukaemia virus, feline infectious peritonitis, and feline immunodeficiency virus are some tests that might be suggested when you take cat to vet. In addition to the cat vet check up cost at the kitten check up, there may be additional charges if your cat needs tests.

30. How often should a cat have a health check?

24. Wondering when to take cat to vet? Kittens may need a veterinarian appointment every three to four weeks. Now that you know when to take newborn kittens to vet,

cats over four months of age need annual check-ups. Senior cats might require veterinary appointments every six months.

31. How do I check if my cat is healthy?

It is important to know when to take cat to vet, by keeping an eye on them for possible symptoms of illness, such as frequent urination, diarrhoea or vomiting, change in behaviour, excessive shedding, nausea, lethargy, and loss of appetite.

32. How do you take care of a newborn kitten without a mother?

It is crucial to learn how to care for a kitten, how do you bathe a kitten/how to care for a stray kitten and how to feed newborn kittens without a mother. You can feed them kitten formula instead of newborn kittens milk.

33. How do you take care of a kitten for beginners?

Wondering how to care for newborn kittens, how do you take care of a stray kitten and how to feed newborn kittens? In addition to knowing when to bathe kittens and can I bathe my 1 month old kitten, you must look into their kitten bathing and eating habits and kitten sleeping schedules.

34. How much do you feed a kitten?

Wondering how to feed kittens and how to care for a kitten? Kittens require a higher caloric intake when it comes to how to feed kittens. So, what to feed newborn kittens? Kittens over 6 weeks can be fed a cup of dry cat food every day.

35. What is the best way to feed kittens?

Are you worried about how to care for a kitten or how to care for newborn kittens? In their infancy, kittens are completely dependent on newborn kittens milk as the source of nutrition. They gradually transition to solid food and water from newborn kittens milk.

36. How to get rid of worms in cats naturally?

Foods like pumpkin seeds, chamomile, coconut, carrots, and apple cider vinegar can prove to be very effective against worm infections for your cat. But it is always advisable to visit a vet for a surer treatment against worm infection.

37. How long does it take to get rid of worms in cats?

Worms can multiply in numbers at a rapid pace and can continue to do so even after the first dose of deworm cat medicine. Thus, the process of treatment for worm infection can last for a month to make sure not a single worm is left in your cat.

38. What should I do if my cats have worms?

If you suspect that your cats have worms, you should immediately take it to a vet. Administering medicines to your cat on your own can have a severe impact on your cat. Instead, you should always consult a vet for the treatment of worms.

39. Can humans get worms from cats?

Yes, humans can also get infected by cats. This is why it is always advised to wear gloves while feeding your cat, or cleaning its litter. If you use your bare hands, then avoid putting them in your eyes or mouth and clean them thoroughly.

40. How do you know if a cat has worms?

Different worms exhibit different structures. Thus, you can lookout for signs of them in the faeces of your pet cat. You can also be attentive to symptoms like diarrhoea, vomiting, weight loss, such as worms in cat vomit.

41. What are the characteristic features of cat poisoning?

Most fur babies are vulnerable to toxic items that can lead to poisoning. You can identify cat poisoning from symptoms like coughing, swelling or inflammations, excessive drooling and shedding, fever, seizure and twitching, loss of appetite, diarrhoea, increased thirst and urination, the cat keeps vomiting etc.

42. What causes a cat to vomit food?

There are several reasons you can find your cat throwing up food. While your cat vomits after eating, it often include harmless reasons like an excess of hairball, it might also include other serious reasons like a parasitic or bacterial infestation, indigestion or food allergies, pancreatitis, poisoning, stress and depression.

43. How to treat a cat that won't eat?

If your cat is showing a strong aversion to food, but isn't necessarily sick or vomiting, you can tempt your cat by offering food that has been warmed up, offering strong-

smelling foods (like sardines), or hand feeding your cat.

44. Why doesn't the cat want to eat and vomit?

Your fur kiddo can throw up due to several factors, the primary of which is a food allergy or indigestion. Your cats can also fall sick and refuse to eat due to other health concerns like parasitic or bacterial infestations. The cause of cat puking can also be digestive, renal or liver diseases.

45. What to do when a cat vomits?

If you find your cat throwing up, it is important to remove its food to avoid any further indigestion. You can also renew its water bowl, making sure your cat drinks fresh water and stays sufficiently hydrated throughout the period. Later, you can introduce low cooked fish or chicken to their diet, making sure they are offered in smaller quantities. If the cat vomited green, you must look for professional health and support

46. How long does it take for a cat to heal from skin diseases?

The time taken by a cat to heal from cat skin disease is often influenced by their age, lifestyle and the severity of their condition. Usually, cats can recover from most skin diseases within 8 to 10 weeks, after which the allergic signs disappear. However, if you suspect your cats have skin diseases, it is better to take them to a veterinarian rather than wait for them to heal on their own.

47. Can cat scabies heal on their own?

Scabies is caused by mites and fleas living on the skin of your furry friend. Unless appropriate initiations are taken in order to kill the mites, scabies cannot heal on its own. Once the mites have been killed and removed from your cat's body, topical medicines and ointments can be beneficial in treating scabies even faster.

48. Why does my cat have scabs but no fleas?

Scabs in cats do not always indicate mite or flea actions. Scabs can be caused by several other factors including environmental allergies, agents like debris, as well as due to an injury from a fight with other animals. Topical steroid creams are usually of help in treating scabs and reducing itchiness and discomfort.

49. Why is my cat's skin dry and peeling?

The dryness and peeling nature of a cat's skin can result from several reasons, including food allergies, environmental allergies, and even fungal actions. However,

you can treat your cat by including more Omega-3, zinc, and fatty acids in their diet. Home remedies like apple cider vinegar and water spray are also helpful in treating dry and flaky skin.

50. Can scabies in cats be cured?

Yes, scabies in cats can be treated through topical medications and flea control treatments. Topical medications to treat scabies can be applied by injections, shampoo, or dips. In addition, your veterinarian can also suggest measures to kill the mites causing scabies, as well as antibiotics and anti-inflammatories to treat the skin conditions.

51. What are contagious diseases for cats?
